## **EDM NOTCH MASTER™ 301mr Large Area Metal Removal**

Scan Systems Corporation, through its operating division of EDM SPECIALTIES, manufactures the family of portable EDM Notch Master™. Originally designed as the answer to producing flaws on the inside diameter of pipe, the scope of the equipment has enlarged. Continuous improvements have made the EDM Notch Master™ valuable to any industry that is required to make calibration standards. Not just limited to pipe, the Notch Master™ is used for coiled metal products, forged products, specialty metal products, and manufacturing processes.

The Notch Master™ 301mr is designed to remove large areas of metal to simulate wall reduction or anomalies on both inside and outside diameters of tubular material. The anomalies are used to calibrate inspection equipment during searches for reduced wall content created during manufacturing, wear of material during use, and corrosion of material during its life. Wall reductions can be irregular or regular geometric shapes and electrodes can be crafted to simulate the type of flaws anticipated during inspection.
